Use of Articles in the Pachyonychia Congenita Bibliography

The articles in the PC Bibliography may be restricted by copyright laws. These have been made available to you by PC Project for the exclusive use in teaching, scholarship or research regarding Pachyonychia Congenita.

To the best of our understanding, in supplying this material to you we have followed the guidelines of Sec 107 regarding fair use of copyright materials. That section reads as follows:

Sec. 107. - Limitations on exclusive rights: Fair use
Notwithstanding the provisions of sections 106 and 106A, the fair use of a copyrighted work, including such use by reproduction in copies or phonorecords or by any other means specified by that section, for purposes such as criticism, comment, news reporting, teaching (including multiple copies for classroom use), scholarship, or research, is not an infringement of copyright. In determining whether the use made of a work in any particular case is a fair use the factors to be considered shall include - (1) the purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes; (2) the nature of the copyrighted work; (3) the amount and substantiality of the portion used in relation to the copyrighted work as a whole; and (4) the effect of the use upon the potential market for or value of the copyrighted work. The fact that a work is unpublished shall not itself bar a finding of fair use if such finding is made upon consideration of all the above factors.

We hope that making available the relevant information on Pachyonychia Congenita will be a means of furthering research to find effective therapies and a cure for PC.

Keratin expression in skin tumors

In keratin expression in skin tumors, the expression of keratin is detected through immunohistochemistry. The image shows different patterns of keratin expression in various skin tumor types. The patterns include diffuse, focal, and negative staining.

Diffuse expression is observed in areas where keratin is highly expressed, indicating a high level of keratinization.

Focal expression is seen in discrete areas within the tumor, suggesting localized differentiation.

Negative expression indicates the absence of keratin expression, which can be indicative of certain types of skin tumors.

These patterns are important for the diagnosis and classification of skin tumors, as they can provide insights into the cellular differentiation and potential malignant transformation.

Skin cancer is the diagnosis of human skin cancer.

Application of the Diagnosis of Human Skin Cancer

Targeted for colonized, the diagnosis of skin cancer is additive to the progression of cancer and provides the assessment of its potential to metastasize. The expression of K14 and K17 would be essential to determine the potential of skin cancer.

The expression of these proteins is a target for the diagnosis of skin cancer. The expression of K14 and K17 is additive to the progression of cancer and provides the assessment of its potential to metastasize.

Skin cancer is the diagnosis of human skin cancer.

White boxes are associated with malignant condition when
