Use of Articles in the Pachyonychia Congenita Bibliography

The articles in the PC Bibliography may be restricted by copyright laws. These have been made available to you by PC Project for the exclusive use in teaching, scholarship or research regarding Pachyonychia Congenita.

To the best of our understanding, in supplying this material to you we have followed the guidelines of Sec 107 regarding fair use of copyright materials. That section reads as follows:

Sec. 107. - Limitations on exclusive rights: Fair use
Notwithstanding the provisions of sections 106 and 106A, the fair use of a copyrighted work, including such use by reproduction in copies or phonorecords or by any other means specified by that section, for purposes such as criticism, comment, news reporting, teaching (including multiple copies for classroom use), scholarship, or research, is not an infringement of copyright. In determining whether the use made of a work in any particular case is a fair use the factors to be considered shall include - (1) the purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes; (2) the nature of the copyrighted work; (3) the amount and substantiality of the portion used in relation to the copyrighted work as a whole; and (4) the effect of the use upon the potential market for or value of the copyrighted work. The fact that a work is unpublished shall not itself bar a finding of fair use if such finding is made upon consideration of all the above factors.

We hope that making available the relevant information on Pachyonychia Congenita will be a means of furthering research to find effective therapies and a cure for PC.
Enlarged teeth in newborn

DISCUSSION

In this study, the effects of prenatal and postnatal environment on the development of neural function were explored. The results indicate that a combination of prenatal and postnatal factors can significantly influence neural development. Prenatal factors, such as maternal nutrition and health, play a crucial role in setting the stage for subsequent development. Postnatal factors, including environmental stimulation and early intervention, also contribute to the development of neural function.

These findings suggest that interventions aimed at optimizing prenatal and postnatal conditions can have a positive impact on neural development. Further research is needed to understand the mechanisms underlying these effects and to develop effective interventions that can be implemented in clinical settings.

In conclusion, the results of this study highlight the importance of considering both prenatal and postnatal factors in the development of neural function. Future research should focus on developing comprehensive interventions that can be used to optimize neural development in at-risk populations.
